

## Certificate

In its decision of 29 June 2026, the FSM Expert Commission concluded that the Dedit-AVS enables reliable age verification to be carried out in order to guarantee a closed user group within the meaning of Section 4(2), second sentence, of the JMStV, and thus to ensure that only adults have access to appropriately protected content.

Age verification takes place in a three-step process, in which the end user captures an identity document using a camera or transmits the identity document details via NFC, and subsequently carries out a biometric comparison of the user's live selfie with the person on the identity document. In the event of subsequent authentication, a fresh biometric comparison is carried out between the live selfie and the stored data.

Assessments relating to data protection, contract law, copyright law and competition law were not included in the review.
